

Dear FDA:

In the July-August issue <sup>1980</sup> <sup>pg 38</sup> of my Sierra Club newsletter, there <sup>was</sup> <sup>JUL-97</sup> <sup>PJ:38</sup> an article about r-BGH being injected into cows to make them produce more milk. I am very worried about the effects of this hormone on humans.

As a vegetarian, I rely heavily on milk for protein, and I drink a lot of it. It is important to me that milk is safe.

I don't necessarily think r-BGH should be banned, but I do think that milk and meat from injected cows should be labeled as such. Labeling would allow consumers to decide for themselves if they want to purchase products produced from hormone-injected cows.

Thank you, Gwen Johnson
